Abstract: The environmental impact statements for the Gulf of Alaska and Bering Sea Aleutian Islands groundfish fishery management plans were prepared in 1978 and 1981, respectively. During the intervening years, the fisheries have evolved from primarily foreign fisheries to completely domestic fisheries. The management plans governing the fisheries have been amended numerous times. New information is available concerning the ecosystem, the science of fisheries management has progressed substantially, public opinion about management of these fisheries has changed, and several bird and marine mammal species have been listed as threatened or endangered under the Endangered Species Act. This SEIS was prepared to establish a new baseline of environmental and economic information, bringing the federally managed groundfish fisheries into compliance with the National Environmental Policy Act. Analysis presents the impacts of groundfish fishing on the biological and economic environments that result from a broad array of policy-level programmatic fisheries management alternatives.
