

Pollock Roe Production Summary Data and Graphics, 2002-2006, by week and sector.

**Prepared by Scott A. Miller
Economist, NOAA Fisheries Alaska Region Analytical Team.
From Data supplied by Terry Hiatt of the Alaska Fisheries Science Center**

Introductory Notes:

The data presented here are intended to meet the needs of the SSLMC in evaluating several proposals. Included in this section are production and value data and graphics for all sectors combined as well as for the combination of motherships and catcher processors, and for shoreside processors only. This data has been supplied by Terry Hiatt, of the Alaska Fisheries Science Center, and is derived from weekly production reports submitted by industry. Mr. Hiatt provided the raw data and Scott Miller of the Alaska Region of NOAA Fisheries processed the data into the tables and graphics presented here.

Please note that this is a preliminary data product and may be used only in the SSLMC process but may not be recreated, redistributed, copied, or referenced without the expressed written permission of the author.

It is important to note that this data is not broken out by BSAI versus GOA. The reason for this is that much of the shoreside data, which is the only data that shows any changes in value by week, is confidential when broken out regionally.

This data has been shown in thousands of pounds, thousands of dollars, and dollars per pound. This convention was used, instead of metric tons, because it allows intuitive comparisons and eases the creation of graphics. However, the data could be displayed in metric tons and if that is a wish of the SSLMC with regard to future analysis, please indicate so during your review of this data.

Within the data tables are some cells filled with “c” or “C” to denote confidentiality. The lower case versus upper case use is a programming convention but they mean the same thing.

Also of note is that two figures are presented for each table in the first section of this document. The first figure shows the entire year. However, the second figure is a snapshot of the first 20 weeks of the year. This was done to better show the changes in pollock roe production timing that have occurred in the past several years.

Discussion of Specific Proposals:

Proposal #1:

A cursory review of the data reveals several things. First, production data indicates that there has been a shift of A season pollock roe production to earlier in the A season over the past several years. Second, shoreside value data seems to indicate that early season pollock roe value per pound is higher than later in the season; however, catcher processors and motherships are reporting a single value for all weeks of the year. Thus, it will not be possible to evaluate the change in value of earlier roe production with this data.

Proposal #2:

The need for value of non-roe fish versus roe-fish was identified for this proposal. The following tables provide data that can be used to evaluate comparative product value. Especially helpful will be the tables in the section titled Base Pollock Production Data used for Summary data and Graphics. That section provides extensive coverage of pollock product values by week and sector.

Proposal #22

A data need was identified of an estimate of present ex-vessel and 1st wholesale value per ton of AI pollock using historic AI pollock size distributions and roe recover rates. This data request has not been met due to confidentiality of nearly all the data for the AI pollock fishery. However, it is possible to evaluate this proposal using the product value tables for the combined BSAI and GOA presented in the tables in the section titled Base Pollock Production Data used for Summary data and Graphics. Although it is not in ex-vessel format, the shoreside processor data on first wholesale value of roe products as well as the total value by week can be used to evaluate this proposal.

Proposal # 28:

A data need of percent of roe production at the end of October was identified for this proposal. Data contained in tables 11 through 14 and figures 21 through 28 will be useful in evaluating this proposal. A review of this information shows that percent of roe production at the end of October was as high as 2% in past years, but in the most recent years has fallen to negligible levels.

Proposal #9:

A data need was identified of determining how much B season cod TAC, for pot CVs ≥ 60 feet, is left unharvested and will moving that TAC to the A season help achieve full harvest. NOAA Fisheries Alaska Region in-season management staff are processing a data request to answer this question but the output may not be available until January 8th.

In the meantime, preliminary review of this question by in-season management staff suggests that this sector stops fishing Pacific cod in the B season in order to fish crab. After the crab season has closed, some vessels do not finish the Pacific Cod B season. However, indications are that all (most) of the Pacific cod that any sector leaves is presently used. This might mean a clean up fishing opening on December 30 and staying open through the new year. A more definitive answer, including data showing remaining TAC and how it is utilized, will have to wait until the data request is completed. That information will be forwarded to the SSLMC just as soon as it is available.
